Navajo Culture & Its

Relation to Alcoholism

by

Galen Snell
&
Bobby Garrett
I. INTRODUCTION

The Navajo represent one of the relatively few cultures which has failed to develop a native alcoholic beverage. At present, however, excessive drinking is a major social problem (Navajo Yearbook 1961:276). A number of writers who have studied the Navajo have mentioned factors they believe to contribute to alcoholism within the tribe, but there are apparently no studies specifically related to this problem from a theoretical point of view. It was approached in a conference called in 1960 by the Navajo Tribal Committee on Alcoholism, which explored the subject from the points of view of the sociologist, the law enforcement officer, the medical worker, the religious worker, and others; but their only contribution was the encouragement of a rehabilitation program (Navajo Yearbook 1961:277). Horton (1943:4, 1, 199-320) extracted a number of variables that he found correlated with drinking in primitive societies, but in a review of the literature there was found no detailed analysis of alcoholism in a particular society. Not only were no studies of this kind found to guide in the present research, but the material that exists of this type in relation to the Navajo culture is incidental and inadequate. The purpose of this study, therefore, is to present, from the literature, theoretical approaches to the etiology of alcoholism with special reference to cultural determinants and to examine the Navajo society for possible specific contributing factors which would lead to hypotheses to be tested in field research.

II. THEORETICAL DETERMINANTS OF ALCOHOLISM.

A. Cultural Variables.

Alcoholism has been approached from many different ways by different theorists. Some have emphasized the physiological, others the socio-cultural or psychological variables within these disciplines devious paths have been taken. The results of physiological studies will not be considered here, not because they are unimportant but because they are inappropriate to the cultural orientation of this paper. The word cultural will be used to include both socio-cultural variables and psychological variables which are more or less common to the society. Lemert (1956:117, 306-317) has presented the case for socio-cultural etiology by pointing to the fact that the rate of alcoholism is different for men and women, for urban and rural areas, for detached people and married, and for different American ethnic groups.

Horton (1943:4, 1, 199-320) indicated that anxiety is significantly correlated with alcoholism. His study consisted of the analysis of several societies in terms of the factors that were common in those which showed a high instance of alcoholism. He attributed this anxiety to basic insecurities of primitive life, such as drought, insect plagues, floods, crop failures, or any threat to the food supply. In societies with subsistence insecurity, disregarding those in which acculturation was a factor, the degree of insecurity was related to amount of insobriety, the probability being between .01 and .02. When the acculturated
cases were added, the significance rose to .01. Thus, not only subsistence anxiety, but cultural anxieties were related to insobriety (Horton 1943:268-269). A similar relationship was inferred by Honigmann and Honigmann (1945:5, 575-619) by observation among Athapaskan Indians in Canada. Horton concluded: "...that in many societies subsistence insecurity could be attributed to conditions created or intensified by the process of acculturation--settlers encroaching on the land, driving away game, or forcing the natives to less fertile soil, displacing whole populations to reservations, destroying native industries, and the like..." (1943:268)

Acculturation was also found to be an important factor in Horton's analysis of primitive societies. When acculturated societies were compared with non-acculturated ones, there was a higher incidence of insobriety in the former, while there was about an even split between strong insobriety and moderate-or-slight insobriety in the latter (1943:269). Washburne (1961) in his investigation of primitive drinking gave a rather complete description of the cultures which he discussed. Of the six cultures of which it was said that drinking was heavy or drunkenness was deep, acculturation was present in the cultures of five, was mentioned as related to drunkenness in three of these, and was mentioned as a problem in another. Caution needs to be exercised in assuming that the term 'acculturation' refers to equivalent circumstances in these two studies. However, Horton and Washburne are in agreement that acculturation can play a significant role in alcoholism in primitive societies.

Horton used belief in sorcery to indicate repressed aggressive anxiety (1943:286). He interpreted the association of insobriety and drunken aggression with belief in sorcery as evidence of the contribution of repressed aggression anxiety to excessive drinking (1943:292). Shalleo (1941:2, 464-478) cited Bunsel's study of Guatemalan and Chamulan drinking in relationship to repressed aggression. In Guatemala excessive use of alcohol did not bring out aggressive violence. In Chamula no one was safe when alcohol was used. There existed a strong belief in sorcery and sorcerers were considered arch enemies who were killed with public approval.

B. Personality, Variables.

A great deal of research has been done on the psychological dynamics of the alcoholic, and it is not difficult to find theoretical explanations for the etiology of addiction in terms of personality variables. Before discussing the personality traits found by some researchers, it should be emphasized that a number of investigators are not convinced that the alcoholic is distinguishable from other clinical types. A number of personality structures have been found among outpatients (Schaefer 1954:317). Button (1956:17, 35-52), Rosen 1960:21, 253-266), Manson (1949:5, 77-83) and Schaefer (1954:15, 304-319) deny that there is a unique and clinically accepted personality that can be identified with alcoholism. Schaefer emphasizes the disagreement among theorists that was found in research for this paper. One difficulty with studies concerned with personality variables in the etiology of alcoholism is that in most cases the subjects had been drinking excessively for a long period of time. No distinction can be made in these investigations between traits existing before onset and those which came after and perhaps resulted from drinking.
Schaefer (1954:317) has used factor analysis to determine five personality types. The first is the schizoid type. The second, the normal personality, is found in the person who drinks as a reaction to fear, anxiety, and stress of non-neurotic character. The third, uncontrolled type, shows inability to exercise restraint, accept responsibility, or follow conventions, and resembles the psychopath. The emotionally unstable are over-emotional, moody, and unrestrained. The psychoneurotic exhibits pronounced sexual conflict and feelings of inadequacy.

Manson (1949:5, 77-83) developed a questionnaire which in one study identified alcoholics from non-alcoholics with an accuracy of eighty per cent. Using this test and the Cornell Selectee Index, he found alcoholics significantly higher in neurotic scores than non-alcoholics.

One clinical type with which alcoholism has been associated is the obsessive compulsive. Podolsky (1960:237) says that this type resorts to alcohol to moderate tensions, anxiety, and guilt feelings, and to moderate the pressures of ritualistic behavior and obsessive thoughts. Paster (1948:58) links alcoholism with the psychopathic personality and sees it as a phase in the total seeking of pleasure. Like the psychopath, the alcoholic usually begins to develop his symptoms in adolescence in reaction to the strains of that period and falters under the strain of beginning family and career responsibilities. He demands pleasure continuously, has little sense of reality, and accomplishes nothing worthwhile. He yields to wishful thinking and thus finds perseverance difficult (Buhler and Lefever 1947:259, 197).

Although agreement on personality variables is not a reality, there are a few traits that seem common to alcoholics; at least the frequency with which they appear is impressive. It is the layman's belief that drunkenness is a means of escape, and a number of studies show a trend of this sort in the alcoholic. One of these (Halpern 1946:6, 468-479) indicates that the alcoholic is not able to admit personality inadequacies and must find a passive way of dealing with difficulties by putting the problem outside himself where it can make no demands on him. Schilder (1941:2, 277-292) says that the chronic alcoholic has lived in a state of insecurity from earliest childhood. Intoxication gives him temporary "social security" by making him feel loved and appreciated because of his capacities, attractiveness, and sexual qualities, and makes him willing to give appreciation as well; in other words, he has a sense of normal social capability. Podolsky (1960121, 292-297) says that alcohol smooths over conflict material, guilt, shame, anxiety, and feelings of inadequacy, as well as giving an excuse for a social behavior or, on the other hand, permitting outgoing social behavior. To Paster (1948:58) the alcoholic uses drink to lessen sensitivity to pain and induce pleasurable feelings, to avoid frustration and hardship. Bird (1949: 9,532-543) emphasizes that the reality that is feared is not primarily that of the outer world, but the real dangers within the person himself. The anxiety that leads to this desire for escape may well arise from a lack of confidence in one's ability to deal with the world, whether internal or external. Hampton (1953167-83), in developing a questionnaire for drinkers, found that alcoholics rate lower on self-confidence than non-alcoholics, even though the alcoholic subjects in his study had 76.90 per cent of their group in executive, managerial, business, minor supervisory, or skilled manual occupations to the non-alcoholics' 52.41 per cent, and earned $2,000 per year more than their, control group.
Alcoholics show significantly high anxiety and apprehension coupled with low tension tolerance according to a Rorschach study of chronic cases (Buhler 1947:1258). Psychoneurotics were differentiated by their high tension tolerance with anxiety and psychopaths by low tension tolerance with little anxiety. The alcoholic's anxiety seems to result from the loss of control in acute tension situations.

According to Strecker (1941:2, 12-17), drinking has the purpose of regression to a state of lessened responsibility. There seems to be a vital conflict between the needs for passivity and activity, for dependence and independence. Lsansky (1960:21, 314-343 believes that an imbalance of frustration and satisfaction in childhood predisposes the individual to strong dependency needs and weak, inadequate defense mechanisms against these needs, resulting in a dependence independence conflict. Hampton (1951:34, 211-222) found simultaneous feelings of superiority and inferiority and a striving for perfection. Halpern (1946:478-479) saw the alcoholic as unable to admit his inadequacies, interpreting disturbing situations as challenges and driving to prove himself, while all the time desiring a passive role. Kaldegg (1956:17, 608-627), however, found the alcoholic to be passive but lacking in drive and incapacitated in the face of personal difficulties. The passivity is reflected in the alcoholics' leisure time activities (Hampton 1953:76). They show less interest in active sports than non-alcoholics, and prefer reading and playing cards. They rate higher in enjoyment of entertainment, but they are low in a more active social activity, dancing.

The family background, according to Knight (1937:86, 538-548) consists of an over-solicitous mother, opposed by a stern, cold, harsh father. There appears a great inconsistency in discipline and training, which results in the child becoming too dependent upon his mother and afraid of his father. Hampton (1952:26) shows that this family constellation causes the alcoholic to project his hostility upon the world and, in turn, he believes that the world is hostile toward him. The world is identified with the father. Alcohol provides him an opportunity to escape from this hostile world (father) and return to the infant stage of mother dependence, where harm is warded off by a solicitous mother and gratifications are easy, simple, and oral. Other psychoanalytic writers disagree with the above interpretation of the relationship of the family. Simmel (1948:20) wrote that the mother for whom the alcoholic longs really never provided him with any security whatever. "They are mothers who indulged themselves without consideration for the child's needs. Such mothers may overindulge the child during the process of nursing and become tyrannically strict about toilet training and cleanliness... All my alcoholic patients had deeply seated hatred for their mothers... This deep hatred of the alcoholic for his mother is deeply repressed as an impulse to incorporate, to destroy b devouring the mother (Simmel 1948:20)." Bergler (1946:7, 356-359 believes that the alcoholic drinks to show the depriving mother he can get all the non-milk liquid he wants. He drinks also because of the injurious effects on himself, identifying with the mother and filling her with poison. Thus the alcoholic, by his drinking, is able to torture those who care for him, tending to destroy them, and with them, to destroy himself. His addiction, according to Simmel (1948:19), is chronic murder and chronic suicide. This murder and suicide is the alcoholic's wish to return to the womb. To the unconscious, it is a return to Nirvana, pre-existence in the mother's womb, complete oneness with her, where love and hate do not exist.
Alcoholism has been linked by some researchers to homosexuality. White (1956:408) shows that in cases of long standing homosexuality there exist a "...strong connection of some kind between heterosexual interest and anxiety." This might come from the ambivalent attitude toward the mother. Another aspect should be shown also. The homosexual has had difficulty in establishing the father as an ego ideal with which to identify. Mowrer and Mowrer (1945:6, 36-44) discuss how the alcoholic dislikes his father and his brother, who seems to be favored by the father. This family constellation leaves only the mother (and sisters) with whom to identify. Male ego identification becomes very difficult. Tabori, Juliusburger, and Read believe this aspect to be the most important etiological feature of the alcoholic. Read (Hampton 1952:26) says that alcohol is a necessary part of modern civilization. Alcoholic intoxication provides a man the opportunity to develop the abnormal homosexual friendships and contacts which he so much desires. Alcohol removes inhibitions and increases sexuality, and every drinking episode is a homosexual experience. Higgins (1953:49, 713-726), citing one case history, gave the family constellation as consisting of a mother regarded as powerful and potentially destructive of man's strength and a father seen as a weakened mace whose main expression of "masculinity" and hostility toward women is defiant drinking. Hewitt (1943:4, 368-386) administered the MMPI to alcoholics and found low scores on the Masculine Feminine scale. His study tends to contradict the above evidence. Yet the greater amount of studies, including Machover, Soloman, Puzzo (1959:20, 505-542), and Schaefer (1954:15, 304-319) indicates a definite correlation between alcoholism and homosexuality, or at least covert homosexuality.

The question arises as to why the alcoholic chooses drinking instead of other flights from reality, i.e. neurotic defenses, drugs, etc, Kohler (1945:25, 565-574) believed that the most important part of the etiology of alcoholism is the suggestive power of drinking fashions promoted by the alcohol industry. Buhler and Lefever (1947:8, 197-260) suggest, "The one quality common to all types of chronic excessive drinkers is their desire for the special kind of release given by alcohol. More definitely then other neurotic or emotional releases, alcohol tends to remove rationality and reality. It seems logical that alcohol should be used mainly by individuals no matter what their predicament who want to get away from a too well functioning rationality." This sense of reality combines with the alcoholic's lack of inner defectiveness to make him feel his goals are not worthwhile, and strong sensitivity enhances his self disapproval, Though we have generally disregarded the physiological aspect of alcoholism it is well to mention here Williams' study (1947:7, 557-587) in regard to the escape mechanism of alcohol. He said that no psychological stress can make an individual an alcoholic unless he had inherited a metabolic pattern which renders him susceptible that it is heredity which explains the differences in craving for certain foods and drugs, and the differences in alcoholism among individuals and races.
III. NAVAJO HISTORY.

It is impossible to trace the Navajo to any point in time earlier than 1541, the date given to a hogan found in Northwest New Mexico (Underhill 1953:95). It is known that they were originally a tribe no larger than any other of the Apache bands. Nor they number more than all the others put together. Underhill (1953:37-38) attributes this growth to the Navajo ability to learn. She says that this flexibility has been the keynote of Navajo life. The People, as they are called, were so adept at taking any opportunity to appropriate a useful part of another culture that they can be called the greatest learners among the American Indians.

In fact, by looking at different parts of the Navajo culture, we can see that it was built to a great extent by assimilation and learning. The People adopted the clothing, probably, of the Paiute and Pueblo Indians on their migration from the North to the Southwest, where skins were scarce. Neither pottery making nor basket weaving was original with the tribe, but was learned from others. The stone house was a product of the association with the Pueblos, and were three vital parts of the Navajo economy, farming, weaving, and sheep raising. The importance of the horse cannot be overestimated, and it came from the Spanish. Though the Navajo had worn silver since the time of the Spanish, it was primarily from the encouragement of traders that the People learned silver smithing as a trade. The existence of various clans of non-Navajo origin among the larger Navajo group attests to the habit of assimilating other people into the tribe. This incorporation doubtless led to many cultural changes (Underhill 1953). It should be noted that it was primarily the material culture that was influenced by other groups. Even after modern contact with the whites, the Navajo retained characteristic ways of dressing and decorating to a large extent. Their morals and religion remained unchanged by cultural contacts and the efforts of the missionaries. Their ceremonial life and social structure, including family organization, remained the same (Kuehnsted 1941:101-105).

With the advent of the horse, the Navajo became a successful raider. Raiding parties were got up by young men who wanted sheep, slaves, and horses, which were needed for acquiring brides. They raided just as a young man today starts a business. Slave raids were also frequently made among the Navajo by the Utes, Apaches, Comanches, and Mexicans (Underhill 1953:115-116, 125). When the United States acquired the area inhabited by the Navajo as a result of the war with Mexico, Kit Carson was assigned the task of subduing the tribe in 1863 (Pollock 1942:67). The once proud people were forced onto a reservation at Fort Summer where, after two hundred years of wild freedom, they were reduced to semi servitude. Without their sheep for food and for weaving yarn, they were forced back into dependence on agriculture. Cold, hunger, and repeated crop failures, along with low morale, were their lot until the conquerors set aside a new reservation in their old country. There their economy became a combination of agriculture and sheepherding (Pollock 1942:15).

With the rapid increase of the sheep stock, the people became comparatively wealthy. At the turn of the century it was apparent to a few Indian agents that over-grazing was becoming a problem, but no action was taken by the government (Pollock 1942). In 1933 there were almost one and a half million sheep, besides horses and goats, on a reservation capable of handling only a half million (Pollock 1942). This situation arose in part due to the encouragement given by
most white traders, missionaries, and government workers during the years from 1870-1928. In 1933 there came a complete reversal in a forced stock reduction, which was carried out without understanding of the psychological or cultural background of the Navajo. Many promises were made by the government to offset the reduction, but the promises were not fulfilled (Pollock 1942). The reduction was inequitable, in that small owners were hurt much more than the wealthy sheep raisers. A second reduction took away the goats, which were shot and left to rot, and thus deprived the Navajo of his source of milk and skins. Later the horse stock was drastically cut, hurting the Indians more in prestige than in any other way, though the three horses left each family were not adequate for some. What had been anxiety, -------fear and bewilderment became hate and a sense of utter defeat (Pollock 1942:141). The Indian Service’s policy was to develop a conservation program for saving the land as a means of saving the people, but the Navajo see only inconsistency in the program since, to them, it stressed the saving of the land regardless of the economic and social cost to the people (Pollock 1942:15).

Poverty has been a general characteristic of the Navajo that remains today. Except for a few brief periods of prosperity in the 1880’s the tribe has been faced with the necessity to make a living from inadequate resources. The land they returned to from Fort Sumner was inferior to the land that was traditionally theirs in the San Juan River area of Northwestern New Mexico. Their former land was taken over by settlers and the Navajo, as a defense, poached on the land and often killed the settler's cattle (Bureau of Indian Affairs;4-5). Increasing population resulted in overgrazing, which caused erosion of the already poor land. Of the fifteen million acres, one million are barren, seven hundred thousand are inaccessible. The climate is described as arid or semiarid, and many portions of the land have little usable vegetation (You Asked About the Navajo: 17) With the loss of sheep, wage work became very important. World War II brought a great many jobs and ameliorated the situation somewhat. Many of the youth enlisted in the armed services, increasing the amount of money available to the people. Another crisis resulted with the end of the war, since the return of Navajo veterans made more jobs necessary just as many wartime jobs were being terminated (You asked About the Navajo). Due to stock reduction in the thirties and the increase of jobs for the Navajos during the war, the social and economic structure of Navajo society underwent many important changes. One of the most important of these was the change from an economy based on agriculture to one based on wage work. Wage work became the backbone of the economy for most of the people, while agriculture became only a supplementary income (Navajo Yearbook 1961:156). Before 1933 fifteen per cent of the Navajo families were large sheep herders deriving nearly all their living from their flocks. Today less than one half of one per cent of the Reservation families own 300 or more sheep; whereas twenty to twenty-two per cent of the Navajo families living on the reservation earn a regular annual income ranging from $1,600 to $15,000 per year, the median being perhaps $4,000. This income is derived from wages received from employment with the Tribe, government, public schools, and private industry, such as uranium mills, pipelines, and gas companies (Navajo Yearbook 1961: 218). All this means a much greater amount of income among the Navajo today; however, this money is widely distributed. "In fact, the sharing of resources with less fortunate kinsmen exerts something of a leveling influence on the family income level of the more affluent segments of the population (Navajo Year Book 1961:220)."

Another important source of income for the handicapped, needy children, and old people is the welfare programs of the individual states. New Mexico's welfare expenditures have risen from $839.50 in 1951 to $68,784 in 1960 (Navajo Yearbook 1961:301). In the experience of one of the authors who worked closely
with the Navajo for a period of four years, this has been a very important source for many Navajos who have been unable to care for themselves. This assistance not only takes care of the one it is intended for, but also others in the family.

One more aspect in the changing Navajo economy needs to be mentioned. The Navajo lands were found to be rich in many minerals and petroleum. From 1935-1960 about $115,000,000 were received from this source. In 1957 alone a total of $35,500,000 was received (Navajo Yearbook 1961:268-269). The royalties do not go to the individual Navajos, except in cases of private land ownership, but are maintained and administered by the Tribal Council, giving increased importance to the Council and greater unity to the Tribe. This money is being used for the general betterment of the Tribe, with special emphasis on economic development (Navajo Yearbook 1961:182).

IV. NAVAJO CULTURE AND PROBLEMS.

A. Alcoholism.

The alcohol problem among the Navajo is longstanding. Navajo Agent Bennet complained in 1880 that several traders at nearby trading posts were selling whiskey "of the vilest description" and giving it to the Navajo in open violation of the law (Navajo Yearbook 1961:275). In 1802 the United States Government gave the president of the United States the power to ban all liquor traffic to Indians. In 1832 a law was passed that made the sale of liquor to all Indians a crime. In 1953 this law was repealed. New Mexico and Arizona soon followed suit. In the repealing of these laws the option was still left to each Indian tribe to keep liquor off its respective reservation. Those white people interested in the repeal of the liquor law felt that with time and experience, excessive use of alcohol would abate and be no more of a problem than is found outside the Indian country (Navajo Yearbook 1961:276). It was also argued that one could not prevent alcohol from being sold surreptitiously to the Navajo anyway. After seeing the results of the open liquor law one trader, who had voted for the repeal, told one of the authors that he was appalled at the havoc that it has made among the Navajo. The records of the Navajo police and Navajo courts show that the amount of crime due to drinking has increased considerably. In 1941 about fifty per cent of the crimes that came to the attention of the courts on the Reservation had to do with alcohol. In comparison, 79.5 per cent of all cases that were tried in the Tribal Courts in 1958 were due to the alcohol problem. These cases increased to 85.9 per cent in 1959 and 84.3 per cent in 1960 (Navajo Yearbook 1961:278-279). It should be noted that this increase is partly due to the improved effectiveness of the Navajo police. Nevertheless, this problem is a costly one to the national population and to the Navajo people (Navajo Yearbook 1961:279). Almost all crimes of violence on the Navajo Reservation are committed under the influence of alcohol (Navajo Yearbook 1961:277), and in the absence of alcohol they are unusual (Navajo Yearbook 1961:273).

Neither society nor the individual is able to control the problem. If, according to Bales (1946:482), the society had been different and there had not been such severe needs for adjustment, or if there had been something other than alcohol offered as a means of satisfying needs, the problem may not have arisen. The Navajo culture can now be examined for ways in which it brings about these needs for adjustment and makes other means of satisfaction ineffective.
B. Subsistence anxiety.

It has been shown previously in this paper that Horton found subsistence anxiety a common problem in the cultures in which drinking was characteristically excessive. The brief history showed that for the most of the past century the Navajo have lived in poverty. As late as 1940 mere subsistence was a pressing problem, and the people were less nearly self-supporting than formerly (Hulsizer 1940). As was also indicated in the history, the situation has greatly improved, especially during the last ten years, due to wage work and increasing concern of government and charitable agencies and the Indians themselves, through their Tribal Council. At this time it cannot be said that the People suffer realistically from subsistence anxiety, but poverty has been dominant in their history and has touched the early lives of those who are now young adults. One of the authors has observed that they are even now generally anxious about their economic wellbeing.

Economic anxiety is exacerbated by contact with white culture. The traditional Navajo, though enjoined to work hard in order to accumulate property, was expected not to get too rich, but to share with his relatives (Hobson 1954:17). Those who feel the effects of acculturation are now becoming interested in washing machines, radios, sewing machines, enameled stoves, and the white man's style of house (Shukry 1954:155). Though the acquisition of these luxuries is becoming more nearly possible through wage work, the men often handle money poorly and cause family hardship. The women are eager for the men to do wage work, but the men now hold the purse strings, and the women sometimes have to ask permission before buying even personal belongings such as clothing. When working elsewhere, the men sometimes do not send money home for months, and the women have to depend on loans from the traders or help from others. There is a good deal of alarm about the man's habits, and old men, women, traders, government officials, and the wage earners themselves deplore the situation (Shukry 1954:160-164). Cars and liquor figure high in reports of consumption habits of Navajo men. Besides the cost of liquor, the men have the expense of fines (Shukry 1954:166-169). Apparently the men have not accustomed themselves to a monetary economy or responsibility to wife and children, which under the matriarchal system belonged to the maternal brother. It is significant that Kluckhohn and Leighton (1947:164) found Navajo children around 1947 were preoccupied with gain and loss of property, even more than children in all other tribes tested and even more than the middle-western white children.

C. Acculturation.

Most of the disruption seen among the Navajo can be attributed to a cultural stress placed upon them by their contact with the white man over a period of the last one hundred years. Throughout their history, the People have been, as mentioned, adept at incorporating material aspects of the cultures with which they came in contact. However, they were always able to keep their value System and social organization intact, indicating the strength of their cultural system. They have not fared so well with the white man. Unlike the previous cultures, his material culture cannot be copied or learned. To have what the white man has, the Indian must imitate the white man himself and become a part of his system. To exist at all, the Navajo must adapt himself considerably to both material and nonmaterial aspects of this larger culture, for his own has now been strangled by
a growing population, restriction to a small land area, the inadequacy of his old economy, and resulting dependency on the white man's economy. Manuelito, the great Navajo war chief who came nearer than any other to unifying his people, recognized as early as the latter part of the nineteenth century the inevitability of change and the means of achieving it:

"My Grandchild, the whites have many things which we Navahos need. But use cannot get them. It is as though the whites were in a grassy canyon and there they have wagons, plows, and plenty of food. We Navahos are upon the dry mesa. We can hear them talking but we cannot get to them. My grandchild, education is the ladder. Tell our people to take it (Underhill 1953:4)

Too much emphasis cannot be given to the importance of this change from one cultural system to another. Kluckhohn and Leighton (1951:112) summarize the problem bests:

"Most of the People today who have not left the Navajo country permanently live in a world which is neither white nor Navajo in the traditional sense, a world where values are shifting and where rules of conduct are in a state of flux. Most of the heavy stresses and pressures for readjustment to white ways have come to the bilingual generation of Navajos, particularly the school children; yet even those who speak no English cannot escape all the frustration and conflict introduced by the impact with white society. At the very least, they are disturbed to see their children adopting non-Navajo ways, and indeed they see their whole world dissolving around them."

They go on to explain that the Navajos are so confused by the conflict between the values of their elders and their white models that they tend to reject the problem of morality, in the widest sense, as insoluble or meaningless. The result is only the principle of expediency to guide conduct, and without generally accepted standards of behavior to give dependability in personal relations, social disorganization is inevitable (Kluckhohn and Leighton 1951:217). Though the Navajos realize that education is the only means of escape from a dying culture into the stronger one on which they now must depend, not only for a livelihood but for social structure, schooling alarmingly speeds up the breakdown, even separating children from parents. On their return from school, children are dissatisfied with the food, living conditions, and traditional behavior, and may threaten to renounce the Navajo way (Shukry 1954:201-202); the college graduate has broken the most intimate ties with his own people (Kluckhohn and Leighton 1951:91). The Navajos are accepting the inevitable and are sending their children to school, as well as giving financial aid to college and graduate students through tribal funds (Navajo Yearbook 1958 s 163-164).

It is obvious that acculturation is necessary, and parents encourage their children to embrace the white ways, though they are hurt by the children's rejection of the old ways (Shukry 1954: 203-204. The young person finds himself pressured to retain his family and tribal identity and at the same time to become a white man (Navajo Yearbook 1961:535).

The Navajo has a compulsive desire to restore lost harmony by a new approach to changed conditions of life. The solution is to harmonize the two cultures by holding on to the old while making the transition to the new (Condie 1958:47, 62). But more contact with the white ways leads to greater dissatisfaction with tradition, and some Protestant schools; in particular, have followed a policy of exterminating the native culture (Kluckhohn and Leighton 1951: 82). If a Navajo
succumbs to the lure of the conveniences and advantages he has taken for granted while in school and tries to move into the white domain, he finds criticism from either side (Kluckhohn and Leighton 1951:113). Navajo veterans found themselves attracted to white values and patterns, but rejected as social inferiors (Vogt 1951:102). The educated adults find themselves punished for exhibiting skills which place them in competition with whites, and for which they were rewarded as school children. They are rejected from the society for which they have sacrificed their culture to enter and often react with an attempted retreat, abandonment of moral codes, or a working but flat and empty adjustment (Kluckhohn and Leighton 1951:114). Navajos who accept the white way are often characterized by few effective ties with other people. Most of those who retain Navajo values tend to have close and satisfying relationships with other Navajos (Vogt 1951:106). "...The result is that Navajos are subjected to pressures for acculturation, on the one hand, and then not permitted to participate fully in the societies to whose patterns they have become acculturated (Vogt 1951:27)."

To fully appreciate the significance for the individual of the disorganization caused by acculturation, it would be well to consider particular values of the Navajo and the corresponding white values which he must accept if he is to make the transition. Something has already been said about the Navajo loss of standards. The white teachers tell the Indian school child what he does is all right if his conscience is clear. The Navajo concept of conscience does not involve standards built up within the person, but considerations of what follows certain actions; stealing is emphasized less than getting caught (Leighton and Kluckhohn 1947: 42), and an action condemned as wrong in our society may be judged solely on the merits of its effect (Condie 1958:65-66). Since the Navajo is too old to develop a conscience when in school, he is left without much restraint except the desire to please his teachers. If interest is lost in them, the restraint is likewise lost (Leighton and Kluckhohn 1947:171).

White emphasis on individualism has had an undesirable effect on traditional Navajo cooperativeness. The custom has been that they depend upon each other for help, advice and sharing of good and bad fortune (Leighton and Kluckhohn 1947:6). The non-Indian is generally oblivious to this important difference the high degree to which the traditional Navajo is controlled by his society (Condie 1958:90). Personal excellence as opposed to personal success is emphasized in competition (Vogt 1951:38). The adoption of individualism leads to the failure of collective and cooperative action, since there is not the simultaneous development of personal responsibility (Kluckhohn and Leighton 1951:236).

The Navajo attitude toward work comes into conflict with that of white society. The white man values work. The Navajo does not value industry in itself but only for what it produces, and works only as much as is necessary (Vogt 1951:36). A Navajo woman married to a Pueblo said, "Pueblos always have to work hard on their farms. If I had a Navajo husband, it would be different; he would go picking pinyons with us. The Navajos they just take it easy (Vogt 1951120)."

D. Repressed Hostility.

Earlier in the discussion it was mentioned that Horton found aggression anxiety related to heavy drinking. There is evidence that there is a large amount of repressed hostility among the Navajos. One important source of this hostility is the family. The traditional Navajos have the necessity of sharing each other's good and bad fortune. The close cooperation and interdependence make it necessary
to conceal any antagonisms that develop, and they are rarely expressed (Leighton and Kluckhohn 1947:6). Hostile feelings may not even become conscious, but they may result in chronic anxieties. The largely suppressed and repressed tensions between brother and sister are indicated in the many tales and myths in which the pursuer of a were animal finds that it is really his own brother or sister (Kluckhohn and Leighton 1951:136, 169-170). Not only can the Navajo not show any hostility he might feel toward other members of the family, but he has also learned through unpleasant experiences that it is fruitless to behave aggressively toward whites (Kluckhohn and Leighton 1951:169-170). Drinking does afford some release through its function as a super-ego solvent, allowing the direct expression of aggression without strong condemnation (Kluckhohn 1944:52-54).

"An uneasy folk is an aggressive folk (Kluckhohn and Leighton 1951:169)." Navajos live lives fraught with anxiety due to an unstable economy, the threat of ill health, and encroachment by the white man with resulting competition, and with competition and conflict between two societies. Navajos experience feelings of personal insecurity, resulting in the manifestation of hostilities toward others. But there are few socially legitimate hostilities in the culture. The witch is not only an appropriate object for the displacement of hostility, but is considered by the society to be the proper object. Witchcraft accusations have increased in troubled times, as just after the subjugation of the Navajos, amid land problems, and during disputes with the Navajo Service. There is good, but not conclusive, evidence that the same is related to white pressure, though crowding may be a factor in such cases. Further evidence of the function of belief in witchcraft as a release to aggression is found in the fact that the victim of the initiation of a witch in Navajo tales is a sibling; and Navajo child-rearing engenders sibling rivalry (Kluckhohn 1944:50-60). During the 1940's, the peyote and other religious cults flourished with anti-white associations in the Shiprock area.

Witchcraft talk was common and there was marked uneasiness, probably the result of the kind of cultural change being experienced, which found emotional outlets in religious cults, oppositions to the government, and in the expression of aggression through witchcraft and numerous quarrels (Leighton and Kluckhohn 1947:125). The belief in witchcraft, ghosts, and witches will be among the last values to leave the acculturated Navajo, because of its relation to psychological tensions (Vogt 1951: 114).

E. General Anxiety.

The presence of extreme anxiety in the Navajo culture is now obvious, and the individual's responses and defenses can be discussed. Vogt (1951:106-107) enumerates four typical responses to acculturation anxiety: an attempt to be as much like whites as possible; psychological escape through alcohol; withdrawal into a personal "shell of defense"; an intensified return to Navajo values. Kluckhohn and Leighton (1951:113-114) list the following reactions: focusing energies on becoming as like whites as possible; becoming followers of vocal leaders; dissipating hostility in factional quarrels or family fights, in indirect hostilities toward whites, through internalization and depression, and in aggression toward witches; flight, either physically, or through alcohol, narcotics, and sex; intensified participation in the native religion or new cults. The reason a person selects a particular reaction depends, according to Vogt (1951:107-108), on his stage of transition between the two cultures. The
person who is not closely integrated in one of the cultures but hovers in the "no man's land" between, lout is closer to the white value side, tends to select psychological escape the one who has retained many of the Navajo values will more likely find refuge in those values in times of stress. The native culture itself emphasizes that the universe is full of dangers, and there is strong preoccupation with threats to security. "One of the most frequent types of responses to threatening situations, especially in those involving whites, is cane of 'passivity' (Vogt 1951:115)." Dittman (1957:642-649) found the Navajos he studied reacting to social and economic stresses by exploring a wide range of adaptive devices, including the use of alcohol, becoming acculturated, heavy indulgence in sex activities, and intensification of traditional religious activities. Shukry (1954:249) reported that women reacted to the problems of acculturation boredom, restlessness, and economic insecurity by escape through sex and alcohol. There seems to be a general trend among both young and old to forsake ambition and inner directiveness on the premise that their efforts will no longer be rewarded (Pollock 1942:139, 167).

F. Family Dynamics.

Much has been said in theoretical treatments of alcoholism about the importance of the family. A close look at the Navajo family, both traditional and acculturated, is revealing. The mother in the traditional family has certain advantages that add up to a degree of domination. The mother owns the family property, and lineage and residence are matrilocal. The women have an independent and ready income through weaving and sheepherding. The woman's importance in the society is reflected in the emphasis on her supremacy in the Blessing Way Ceremony and in the naming of the directions after mythological goddesses. The woman has more contact with the children than the man, since he is rather mobile and is away from home much of the time. He is more an instructor and affectionate companion than a disciplinarian for his sons, while the mother and her brothers are responsible for the discipline of the children (Kluckhohn and Leighton 1951:56) (Shukry 1954:39 -128). Though they lack an identity figure in the father, and the mother is dominant in family affairs, the children have a male identity figure in the maternal uncle. The scene is changing now as acculturation increases and the biological family is becoming more important than the extended family. This has deprived the children of the paternal influence of the uncle, and yet the father has not taken over the disciplinary function (Shukry 1954:128, 199).

Despite the importance of the woman, it seems that the masculine attitude toward her is ambiguous. In the myths, women are characterized as either completely good or completely bad. The women in society are considered the basis of stability, and a man does not make disparaging remarks about female relatives. But dreams, the remarks of a drunk man, or the aggression shown by a man toward his wife or sister when a quarrel does occur make it clear that the evil women of myths represent suppressed attitudes toward women. It is suggested that the negative attitudes arise from the mother's early indulgence of the infant and later abrupt weaning (Shukry 1954:137-138). Although psychoanalytic standards would lead to the prediction that the indulged Navajo child would become a secure and confident adult, the adult is actually moody and worrying, poorly integrated, lacking in personal autonomy, and dominated by public opinion. This unexpected development is explained in part by the difficult weaning or the arrival of a new baby, at which time the child is expected to do simple chores, control elimination, and
settle for the more restricting care of an older sister or grandmother (Leighton and Kluckhohn 1947:34-37, 111).

Family disorganization is frequently a problem among the Navajo. In a study carried out in the 1940's in the Ramah region, it was found that only four out of ten children lived from birth to marriage with their own parents. Both parents were often lost due to high mortality. If a man loses his wife and remarries, he surrenders the children to the maternal family (at least in the traditional system), who will give them for adoption if support is impossible (Leighton and Kluckhohn 1947:46). Though the health situation is improving, it does not follow that the problem is near solution.

Acculturated women tend to become dissatisfied with home life in the hogan according to Shukry (1954:140-147, 212-214, 245). The women at Fruitland were idle, restless, and bored; they disliked their household work and wanted modern appliances. The children were regarded as a burden and usurpers of the mother's freedom. Some of the women desired to have no more children and preferred wage employment to household duties. Disorganization was increased by the pattern of separate recreation for the man and his wife, due to the care of the children, disposition of the husband, and differing levels of acculturation. The most frequent cause of tension between spouses was drunkenness, especially in the husband.

In the same study, the school had assumed primary responsibility for training the children. On their return home, the children were often dissatisfied with the food, living conditions, and behavior, and sometimes threatened to renounce the Navajo way. Navajo young people are becoming more rebellious toward the families. The young people are tending to marry by choice, and the parents have no control, financially or legally, of the choice (Shukry 1954: 201-219).

If sibling position is important in any society, it should certainly be so among the Navajo, due to the rejection and increased demands the child experiences at the birth of a new baby. Children who are actually or psychologically last-born "tend to be more stable, more secure, less suspicious, generally 'happier' (Leighton and Kluckhohn 1947:37)." The younger tend to be less educated and less acculturated, since they have to take charge of sheepherding when their older siblings enter school. If a child comes from a large extended family, he is likely to be less influenced by acculturation, since this type of family tends to perpetuate the traditional patterns through a more thorough orientation of the individual (Vogt 1951:91).

V. CONCLUSION AND HYPOTHESES.

Students of the Navajo are in agreement that acculturation and concern with subsistence, two closely related aspects of the tribal culture, produce a high level of anxiety within the Tribe. As shown earlier in the paper, both theorists on cultural drinking and writers on the Navajo have pointed out the relationship between these two types of anxiety and excessive drinking in a society. It should be cautioned that cultural variables are not considered to function independently of the individual; on the contrary, they have no effect separate from their manifestation in individuals. It is primarily personality variables that are
culturally induced, or at least more or less widespread in the culture, with which this paper is concerned. It should also be made clear that the authors do not consider the variables outlined here to be the only variables, nor the only types of variables operating in alcoholism.

Among the personality variables which theory would suggest is repressed hostility. It has not been difficult to find evidence of repressed hostility in the form of belief in witchcraft, as well as in the means of expression and conditions under which hostility is expressed behaviorally. Considerable emphasis has been given to widespread stress among the Navajo which logically would contribute to high anxiety in the individual. This, if coupled with the low tension tolerance one would expect from frequent frustration, would lead to escapism and strengthen the already existing tendency toward passivity. As the Navajo loses his ability to find coherence and harmony in his environment through traditional belief patterns, and if he possesses the high degree of realism and sensitivity and the lack of inner directiveness found in alcoholics, he would conceivably suffer from an extreme lack of confidence in his ability to deal with the environment and a concomitant need for escape. As the Navajo society has ceased to offer psychological satisfactions, many members have turned to a social behavior, and theorists often agree that alcohol serves to permit this type of release. Finally, though no specific evidence was found for a general dependence-independence conflict, it would be predicted from the information presented on Navajo child-rearing practices.

The information gathered during the research for this paper suggests certain hypotheses which could be tested in the field by comparing a group of alcoholic Navajos with a group of non-alcoholic Navajos, matched for location, thus controlling to some extent the availability of alcohol. In a comparison of these two groups, it is predicted that in the alcoholic group there will be found:

I. A higher level of acculturation anxiety, associated with:

A. A higher degree of ambivalence toward the whites, involving suspicion and covert or overt hostility, along with the desire to integrate with white society.

B. Ambivalence toward the old culture.

C. An intermediate level of education, between the more closely Navajo-oriented non-alcoholics and the more closely white-oriented non-alcoholics.

D. Less effective identity with one or the other of the cultures, with, among other characteristics, less understanding of the Navajo culture than the Navajo oriented non-alcoholic’s and less understanding of the white culture than the white oriented non-alcoholics.

E. An intermediate level of occupation and income, between the Navajo oriented non-alcoholics and the white oriented non-alcoholics.
II. More intense subsistence or economic anxiety, shown in:

A. More concern with subsistence.

B. A higher concern with obtaining luxuries and conveniences.

III. More anxiety, in general, manifest in:

A. A higher level of general undirected anxiety.

B. Higher anxiety about the supernatural, conceivably among Christian converts and peyote cultists as well as among believers in the traditional religion and witchcraft.

C. A higher incidence of passive reaction to stressful situations.

IV. Certain family related variables, including

A. Fewer individuals who are actually or psychologically last-born.

B. A greater incidence or degree of dependence independence conflict.

C. More repressed hostility involving family members.

D. A higher incidence or degree of husband orientation in the family organization.

The Dance Drama of the American Indian & Its Relation to the Folk Narrative

By

Charles Jenkins
The validity of the folk arts as an avenue of inquiry into the structure of human culture has long been established. Nevertheless, it has never been fully accepted as a distinctive scientific approach. One of the results of this development, and possibly one of the contributing reasons as well, is the intensive departmentalizing of the study of the folk arts.

Certainly there has been no lack of interest in the subject, particularly in regard to matters pertaining to the American Indian. But all studies have generally been conducted as separate and distinct disciplines, apparently without relationship to each other. The folk-tales and legends of these people have been widely collected and analyzed with exhaustive attention to detail. Other investigators have been attracted by the rich field of American Indian music. A sizable body of transcriptions and recordings exists in this field of study. The plastic and graphic arts have received their full share of attention from a variety of experts. But each field has developed a parochialism which seems to overlook completely the existence of all aspects save those of its particular area of attention.

In the process, neglect of various aspects of the total study of the folk-arts was inevitable. And nowhere is this more apparent than in the field of the American Indian dance. When one considers the enormous quantity of data concerning American Indian folk culture which has been collected over the years, the scarcity of information relating to this form of the folk arts is remarkable.

The American Indian dance has been largely left to the dubious attention of writers whose interest can hardly be regarded as scientific and whose transcriptions are admittedly lacking in authenticity. Only a handful of investigators such as Kurath, Speck and Fenton have approached the study with any attempt to record completely and accurately.

In all honesty it must be noted that the recording of the folkdance is an extremely difficult matter. Conditions favorable to photographic recording are not always available. Special dance notations, while offering some possibilities, are usually limited in their capacity to record all of the essential movements. As a result, total analysis of dance forms has been rare.

The greatest frustration that the student of the American Indian dance will experience is the marked lack of detailed description of the dance itself, even if only in narrative form. Investigators will dwell with loving detail on the costuming, songs, symbols, instruments and even such minutiae as face and body painting. But the dance itself the patterns, steps, actions, and even at times its very purpose is almost totally ignored beyond the most superficial of descriptions.

Yet in the mind of the Indian, all of these factors are blended into a harmonious entity. It is an integrated development in which the human body becomes the focal point of expression. The complex rhythms of the songs, the kaleidoscopic colors of the costumes, designs and symbols and the movements of the dancers themselves
blend in a living portrayal of the narrative form or subjective theme which underlies the performance. It becomes a complete and vital expression of a total folk-art.

Therefore, as a highly dynamic entity the area of the folk-dance is intimately related to all of the other folk-arts. The study of the American Indian dance is inescapably related to ethnomusicology; the Indian feels that music and dance are inseparable. Dances without costumes or dance properties would lose a valuable dramatic touch. This, therefore, provides a strong connection with the graphic arts. The dance is as rich and varied an area of study as the folktale with as high a degree of special interest. The folk legend plays a vital role in the construction of many of these dances. Yet this interrelationship of disciplines has rarely been considered.

It will be the purpose of this study to investigate two related areas of interest in the context of the folk arts. First, we shall regard the structure of the American Indian Dance Drama and analyze the various patterns of organization to be found within this particular folk-art. Secondly, since the Dance-Drama appears to be uniquely related to the folktale inasmuch as it is an application of narrative forms to a dance medium, we shall attempt to demonstrate the functional relationship between these areas of the folk-arts.

In regard to purpose, there are three general classifications into which the forms of the American Indian dance may be placed. The major style and the one to which the American public is most accustomed might be termed the ENTERTAINMENT DANCE. This dance form is designed primarily for the amusement of the audience and the sheer joy of dancing for the performer. Each dancer proceeds through the movements created of his own ingenuity the sole limitation is the extent of his virtuosity. There is no story to tell, no ritual to follow. While many of the contemporary entertainment dances may have formerly possessed additional significance of a ritual nature, this has passed with the years and the sole purpose today is for pleasure.

A second form may be termed the RITUAL DANCE. Highly mystical in nature and deeply intent on the nuances of ceremony, these dances are filled with intense religious feeling and are heavily charged with emotion. They are generally simple in structure and are usually performed as a mass action.

However, there are relationships within this dance form with the third type, the DANCE-DRAMA. In this form there is developing characterization and expression of narrative structure through an entirely different medium than the verbal tradition.

It is this particular aspect of the American Indian dance that will occupy us in detail. Of all dance forms the dance drama is closest in feeling and thought to the traditional folk literature. In many ways it might well be considered another, more visual expression of the same art.

An examination of the dance drama will demonstrate a regular progression of types, proceeding from the simplest forms to an ever increasing complexity in presentation and approach. This should not in any way be considered to constitute an evolutionary sequence. Each of the particular forms of the dance drama has
its own unique function, and may and often does exist simultaneously with other forms of the dance drama in the same society. In fact, many of the simpler dramatic dance patterns are often incorporated within the longer and more complex structures.

To the extent that the imitative dances by their very nature would seem to be a normative type of development, they undoubtedly have a long history in human culture; therefore, one might anticipate that this type would be relatively old in any given society. But the possibilities of diffusion cannot be overlooked, and a particular dance pattern might well be a recent innovation. In addition, despite any actual duration of existence in a particular culture complex, even the simplest types of patterns have been undergoing changes of one type or another.

By their very simplicity of structure imitative dances could have originated at any time. They might also be the last vestiges of a more complex dance structure. They therefore cannot be expected to reflect invariably and completely the patterns of an earlier period.

Upon analysis the structural forms of the American Indian dancedrama can be subdivided into four areas of classifications

1. The Imitative Pantomime:

In this particular dance form the dancer depicts the actions of a particular bird, animal, fish or occasionally some aspect of human social life. These portrayals generally concern themselves with direct and careful impersonation of the world of Nature. There is rarely anything approaching a plot or complex narrative form. In the few instances in which this might be said to occur, it appears to be simply an elaboration of the actions of the particular subject. Since there is actually no story to tell, the dancer is comparatively unrestrained in his movements.

In general, dances of this type bear the names of birds, animals, etc. However, the name of the dance is no guarantee that there will necessarily be an attempt to imitate the actions of a particular animal. For example, the many "Rabbit Dances" which have been described invariably lack any sort of imitative pantomime. No less than nineteen dances have been reported for the Creek which bear animal titles; yet, not one attempts any type of imitative portrayal.

From a comparative standpoint an investigation of the Bear and Buffalo Dances of the Eastern Woodlands would appear to be particularly revealing. Swanton states concerning the Bear Dance of the Alabama: "The dancers circled about the fire in single file, men and women alternating and pawing at the air with their hands in imitation of the bear." (Swanton 1928:527)

Later, Kurath reports of a Bear Dance of the Quallah Cherokee consisting of a counter-clockwise waddle, men and women alternating clawing the air like bears and ending finally in a tight spiral. (Kurath 1961:179)
Finally, both Fenton and Kurath note the existence of a Bear Dance among the Iroquois. This again was a round dance participated in by both men and women. The step is a grotesque waddling shuffle for the women while the men alternate a forward stamp with a sideward shuffle. Periodically they grunt out hoarse phrases in imitation of the bear's growl. (Kurath 1951:120)

The Buffalo Dances follow much the same pattern. Schoolcraft, in reporting on the Creek, states: "They invest themselves with the scalp of the buffalo, with horns and tail attached and dances around in a circle, uttering sounds in imitation of the animal they represent, with their bodies in a half bent position, supporting their weight on their ball sticks, which represent the forelegs of the buffalo." (Schoolcraft 1891: V: 277)

Later reports of the Cherokee tell of a Buffalo Dance similar in substance and structure to the Bear Dance, but with the substitution of butting and bellowing.

Farther north, Morgan reports on a Buffalo Dance among the Iroquois in which the principal feature was an attempt to imitate the actions of the animal. This dance was supposedly originated as a result of a war party against the Cherokee. The warriors saw buffalo at a salt lick in Kentucky and imitated the actions of the animals upon their return home. (Morgan 1901: I: 276) In a more recent date, Fenton, writing on modern Seneca ceremonies, says: "The Buffalo Society dancers whirl and butt each other." (Fenton 1936:17)

It would appear that the Buffalo Dance is intrusive in the Iroquois dance repertoire and possibly the Bear Dance as well. Although theoretically such imitative examples are so simple in format as to be expected among hunting peoples, the actual structure of the dance coincides so closely as to seem to indicate diffusion of the actual dance form. The fact that the Iroquois were in Cherokee territory when the dance was acquired would seem to indicate that they learned it, not from the buffalo, but from the Cherokee themselves.

In comparison, it is interesting to note that in certain Plains Buffalo Dances occasionally the raw elements of narrative appear. In the Hunkpapa Buffalo Dance there are scenes interspersed throughout the chorus movements of the dancers. Cane scene depicts the mating battle of the bulls, another a hunter stalking and killing a buffalo. But these are simply episodes, and there is no continuity of plot maintained between them.

However, in a report on a dance form from the Fox there seems to be the germ of the next classification. George Catlin described a dance of mourning which he witnessed among these people. Upon the death in battle of a Fox warrior, other members of the war party would dance in his honor before his lodge for fifteen successive days.
These dances were a series of solos and usually involved only a display of dancing ability. However, occasionally a warrior might pantomime one of the exploits of the dead man as a special tribute. This was not obligatory and might be omitted, (Catlin 1841: II: 244) Nevertheless, in this action we see the beginnings of the Dramatic Episode.

2. The Dramatic Episodes:

Here is the dawning of plot formation. There is a sequential stream of action developing along the lines of a recognizable narrative form. For this reason these dances are often referred to as "Story Dances." They are an extremely popular and widespread dance form among the Indians of North America.

The re-enactment of the experience generally took the form of a war episode as a means of boasting of the honors received. Although various descriptive titles have been applied, the standard terminology for this particular type of episodic treatment is the "Discovery Dance." However, the plot need not concern itself with war exclusively. The Ojibwa and other northern Algonkin tribes use the same basic format in hunting dances.

The Discovery Dance is extremely widespread. It would not be amiss to state that it might well be one of the universal dance forms of the American Indian. The early French explorers of the 1600's described the dance in unmistakable terms. Other writers mention it in the Plains or the Rocky Mountains. One version has even been noted in California. It is this universality which gives it the unique character that it possesses. It is at the same time a rigid dance tradition, and yet one capable of extreme flexibility. In short, it permits the maximum of improvisation within a conventional framework.

Perhaps the best description given for this particular dance is by Kinietz for the Southern Ojibwa:

"The performer begins with a dagger, war club or some other offensive weapon, which he flourishes in a variety of ways and threatening attitudes, while dancing. He then hops along for some time, apparently with the greatest of caution and squats suddenly behind his weapon. After having feigned the different motions of loading his gun, he levels the piece at the supposed enemy, runs forward and supposedly finding his victim still alive, pretends to fall Upon him, striking several blows with the war club on his head and finally dispatches him with a mortal stab near the heart with his dagger. He then instantly pretends to make a circular incision with the knife around the head to raise the scalp. After which, he gives the war whoop and dances around the circle. The whole merit of the performance depends on the dexterity and rapidity of the different movements." (Kinietz: 1947: 92)
In the various versions of the dance the details of the war expeditions follow closely the approved fighting procedure of each tribe. In the Mohawk version there is a stalk through the woods, brushing branches to one side, searching the ground for footprints, and finally the creeping approach on the unsuspecting enemy. An Ojibwa dancer used a "canoe" for the journey, and the final attack was made with a bow. In the Dakota version the dancer went through the motions of stripping the cover from an imaginary war shield. The scalping is usually omitted by the Dakota, occasionally by the Mohawk, never by the Ojibwa.

This format is the basic structure of the dance the preliminary boasting, the search for the enemy, the discovery, the killing and the triumph. Within this framework the dancer is free to improvise details at his pleasure.

One might well regard such refinements in dance structure as a form of dance "fabulation." The main plot structure remains intact, but each culture has adjusted the details within the framework to fit its own unique situation.

An interesting modern development in this dance pattern has been noted among the Ottawa. This is called "The Brave Man's Dance" for reasons that are immediately apparent. This dance has come into existence in recent years with the passing of the importance of the original dance. The Brave Man's Dance is a parody of high comic value. The warrior struts his ability and intentions a bit too proudly before the warpath and as a result runs into a series of embarrassing situations.

He flexes his muscles and is shocked that no muscle rises. He pounds his chest and succeeds only in knocking out his wind. On the wartrail he is hideously afraid. His eyes roll in terror; his knees knock together; and he steps on his own foot and cannot think of a way to get off. Finally, when he stumbles upon the enemy, he races in panic to the safety of his village pausing at the end of the dance to shake his fist in defiance. Such a performance might well be considered the final type of interpretive action possible within this framework.

3. The Dramatic Narratives

The major point of difference in this classification lies in the fact that these dances are closely related to the legends of the people--that they are in fact dramatizations of these narratives.

The following criteria should be observed in the Dramatic Narrative Dances:

a. There should be an Episodic Sequences a series of dances performed in a regular order.

b. The dance structure should be Narratives it should either tell a story in the course of the performance or the actions should be in strict accordance with the plot outlines of an existing narrative. There should be a direct connection with the existing mythology of the
people either as a ritualistic performance or as a dramatization of part of the myth tradition.

This development seems to be capable of initiation from either the dance or the narrative form. That is, either the folktale may serve as the inspirational source from which the dance was developed or the folk-tale may serve as an invention to explain the "origin" of the dance after it had been developed. This easy interchange of points of origin serves to demonstrate the high degree of correlation which exists between the oral narrative and the dramatic dance form.

We shall examine for the purpose of this study the structure and relationships of the "False-Face" ceremonies and dances of the Iroquois of the United States and Canada.

There are few persons who have not been shocked and amused by the leering, distorted masks of the Iroquois, if only from the comparatively static environment of a museum collection. But these masks were designed to figure as the center of a great Iroquois dance tradition—a complex, organized body of myth, ceremony and dance which still retains much of its vitality.

These masks were the traditional representations of a vast assemblage of earth-bound spirits which populated the supernatural world of the Iroquois. Fenton accurately describes them as "memorials to generations of nightmares." (Fenton 1941:405) In a sense this statement mirrors reality since the inspiration for a particular mask came to the carver customarily in a dream.

To begin our examination of this dance complex, let us first look at the legends of the origins of these supernaturals.

**MYTH OF THE FALSE FACE LEADER**

"Now, when the maker was finishing the Earth, he went walking around inspecting it and banishing all evil spirits from his premises. As the Creator went his way westward, on the rim of the world, he met a huge fellow—the headman of all the Faces. The Creator asked the fellow, as he has asked the others, whence he came. The stranger replied that he had come from the Rocky Mountains to the west and that he had been living on this earth since he had made it. They argued as to whose earth it was and agreed to settle the title by contest.

"The Creator agreed to call the stranger "Chief" should he demonstrate sufficient magic strength to summon a mountain toward him. They sat down, facing the east and held their breath. Then, the Great False Face shook his great turtle rattle and the uproar frightened the game animals. He summoned the mountain toward him, but it only moved part way.
"Now it was the Creator's turn and he summoned the mountain, which came directly up to them. However, his rival, becoming impatient, suddenly looked around and the mountain struck his face and mouth.

"Now, the Creator realized that this fellow had great power. He assigned him the task of driving disease from the earth and assisting people who were about to travel to and fro hunting. The loser agreed that, if humans would make portrait masks of him, call him "Grandfather," make tobacco offerings and set down a kettle of mush, that they too should have the power to cure disease by blowing hot ashes. The Creator gave him a place to live in the rocky hills to the west near the rim of the world and he agreed to come in whichever direction the people summoned him." (Fenton 1940:418)

It would appear that this story is either a part of the Iroquois creation myth or a tale developing out of a section of the larger epic. However, it does not explain the existence of the other False Faces.

It was apparently a common practice for Iroquois hunters to bring back tales of seeing disembodied human heads, with long, snapping hair, hiding deep in the mists and shadows of the forest. Apparently, these supernaturals did not molest humans but seemed to be extremely interested in tobacco and corn meal mush.

**MYTH OF THE COMMON FACES**

"Later, as humans went about the earth, in the fall, men went into the woods hunting. They carried native tobacco and parched corn meal for mush. They were tormented by shy beings, who flitted timidly behind trees, with their long hair snapping in the wind. Sometimes, a hunter returned to his camp to find the ashes of the fire strewn about the hearth and the marks of a great dirty hand where someone had grasped the housepost for support. The hunter agreed to stay home while his partner went afield.

"During the morning, a False Face approached cautiously, sliding on one hip, now and then standing erect, to gaze about before proceeding. Going to the hearth, he reached into the ashes and scattered the coals, as if seeking something. That night, the hunter had a dream in which the False Face requested tobacco and mush.

"The next day, the hunter set down a kettle of mush for them. The Faces came and taught him their songs and their method of treating patients with hot ashes. In another dream, they requested that they be remembered every year, in a feast, saying that they were everywhere in the forests, bringing good luck to those who remember them." (Fenton 1940:419)

It would seem that we are dealing with two entirely different aspects of the tradition here. The Iroquois mask complex is almost certainly an intrusive adoption; the close relationship to those of the Cherokee cannot be accidental. The first myth, concerning the Earth-Rim-Being, would appear to be a part of
the original Iroquois myth tradition. It is a structured narrative with a plot, characterizations and completed development. The second myth would seem to be a more recent development. There is little attempt at plot structure. It seems to be totally explanatory, as an excuse for performing the ceremonies. Nevertheless, by whatever road the tradition was developed in the Iroquois, it remains a firm pattern today.

The False Face leader, who lives at the rim of the world, is popularly called "Twist face," but is more reverently referred to by the Iroquois as "The Great Humpbacked Defender." He is visualized as a great earth-bound giant, endlessly traveling the world from east to west. He carries a huge staff made from a great pine or shagbark hickory. As he strides across the world, his heavy footsteps shake the earth. At noon he pauses at the Great Pine Tree that grows at the center of the earth and rubs his enormous turtle rattle against the trunk. This renews his enormous strength.

His face, warped and twisted by its collision with the mountain, is red in the mornings as he comes from the east but black in the afternoons as he moves toward the setting sun. In his patrol he is constantly on the lookout for the evil spirits of disease and high winds. He sings as he travels, telling of his powers over these spirits. Occasionally, he dances, kicking his feet in the air and sparring with his hands, with both thumbs held straight up.

He is seldom seen by men in his travels since he promised the Creator that he would remain in the most inaccessible places. He is known chiefly through the myths and by the appearance of his masked representative in the dances.

His subordinates, the Common Faces--the people of the forest mists, take many forms. They are generally depicted as a group of deformed creatures. They are either humpbacked or crippled below the waist. They are not overly intelligent but possess great supernatural powers. For that reason they might be dangerous. Those who can control disease might also cause it, if insulted. Fortunately, they are addicted to tobacco and corn meal mush and will do anything to obtain these items.

They habitually carry rattles of turtle shell or folded hickory back. They converse with each other in a weird, nasal language which is unintelligible to human beings. They possess the power to scoop up hot coals in their hands without suffering burns.

At certain specific periods of the Spring and Fall, although there are no precise dates for the performance, both classes of False Faces appear to go through the houses to rid them of evil spirits. The Dancers carry rattles to frighten the spirits and pine boughs to brush them away.
The masks representing the False Face leader have long hair and are painted red and black. They show his broken nose and the agony that he felt when the mountain struck his face. The Common Faces wear a variety of masks which are distinguished chiefly by a variety of mouth shapes. They also have long hair. No other special costume is worn. Somehow, this adds to the weird effect. It is a distinct shock to see these unearthly faces on a figure wearing blue jeans or peering from under the brim of a battered felt hat.

As they enter each house, the leader chants a ritual formula which appears to be an appeal to the Great-One-On-The-Rim-Of-The-World to confer his powers on the group. This would seem to indicate that there is no concept of "possession" that the spirit is not expected to enter the person of the masker so that the dancer would then become the actual personification of the supernatural.

In fact, the Common Faces were said to have instructed the Iroquois that whenever anyone carves a mask in their likeness, burns tobacco, makes ready a feast and sings the appropriate songs, the power to cure disease is automatically conferred upon him. It is this lack of mysticism which differentiates these Iroquois rituals from other types in the "Dramatic Cycle" dances.

The maskers then spread out throughout the house, crawling from room to room, beating the corners with their rattles to scare away the evil spirits. They blow hot ashes on everyone, especially those who are unwell. Lazy persons run the risk of having undignified jokes played on them. Fenton tells of one masked dancer who crawled into the attic of an Indian house and set up a tremendous uproar. When the rest of the company investigated, they discovered that he was busily engaged in beating a mattress from which hundreds of bedbugs were fleeing for their lives. This "exorcism" was being carried out with all of the proper ritual songs and actions. This is another example of the apparent lack of mysticism in this ceremony. Fenton, in fact, has suggested that the entire complex of masks and actions both extremely grotesque might be a satirical commentary on the essential absurdity of human society.

Following the house visits, the entire village assembles at the community longhouse. The Common Faces burst into the room in a variety of ungainly postures and crawl toward the central fire. The tobacco which has been collected at each house as a fee for the "housecleaning" is burned before the Common Faces can scatter the live coals around the room. An invocation is pronounced to the Common Faces asking their help against epidemics and tornadoes.

Kettles of mush with strips of fried meat (traditionally "as big as their feet") are brought in. At the sight of the corn meal, the Faces roll on the ground in ecstasy attempting to cram their feet into their mouths. They readily agree to cure anyone who is ill.

There are separate dances for each type of mask, but they all follow the same general pattern. The dancers improvise ungainly postures, incredibly distorted angular jumps, hops or twisted crawling movements. The entire effect is one
of unearthly grotesqueness. In the course of the exorcism the Faces utter hideous
groans or converse with each other in the eerie, bubbling, nasal language of the
forest people. One masker straddles a bench and howls the chants at the top of
his lungs while pounding out the rhythms with a turtle shell rattle. The dancers
shake their rattles or pound them on the floor in accompaniment to the incessant
hammering of the singer.

After the dance the Common Faces blow ashes at the assembled people and leave,
carrying their precious kettles of mush.

Now two men, one from each moiety, appear wearing the masks of the Great Earth
Rim Being. They pair off with the matron of the opposite moiety. The couples
dance in unison, hopping on the left foot while bending the right knee and
kicking out with the right foot. The hands are extended, thumbs held stiffly
upright. Occasionally, the partners spar at each other with their left hands.
Then, all persons present are forced to join in the dance, imitating the False
Face beings. The masked dancers guard the door so that no one may leave.

Everyone is then compelled to join in a round dance. One masked being directs the
dance while the other continues to guard the door. At one part of the round dance
a song requests the supernaturals to blow ashes. They repeat the dance with the
women briefly, blow ashes on the assembled people, receive their fees of tobacco
and leave.

As in the myths relating to these ceremonies, it seems evident that we are
dealing with two different but related traditions. The performance of the Common
Faces, while following the narrative tradition very closely, is a highly
disorganized affair. The dances of the Earth-Rim-Beings are highly ritualized,
quiet, restrained and involve the participation of the entire community. There is
rune of the buffoonery, horseplay or uproar of the Common Faces.

However, both dances adhere closely to the myth structure. The Common Faces
imitate their supernatural counterparts with great exactness. The
Earth-Rim-Beings in their dance follow the actions of their supernatural
originator.

There is a triple reinforcement of tradition here. There is the MYTH stating the
original promises of the False Faces to the Creator and the people. There is the
appearance of the False Faces which serves to reinforce the myth itself. Finally,
there is the DIRECT PARTICIPATION OF THE PEOPLE in the ceremony which adds to
the reinforcement through personal involvement.

As a result, the Dramatic Narrative dance forms serve to complement and reinforce
the oral narrative traditions. They provide a cohesive agent to the structure of
society itself and provide an additional bond between the people and the
supernatural. Their vitality can be demonstrated by the fact that these
ceremonies are still a dynamic entity in many Iroquois communities.
4. The Dramatic Cycles

Further elaboration of the dances of the previous class results in the production of Dramatic Dance Cycles, drawing the inspiration from a number of related myths. The costuming, songs, and dances are all designed to portray in careful detail the dramatization of these narrative complexes. Invariably ritualistic, these dances are intended to be presented over an extended period of time in a definite order of appearance.

Almost without exception, and in sharp contrast to the previous dance types, there is little latitude of expression permitted to these dancers. The narrative form itself becomes less important. Symbolism is often developed to a high degree to the extent that the dance structure sometimes becomes subordinated to it. As a result, the content of this form of the Dance Drama may be more abstract in its structure. Possession of the dancer by supernatural agents may occur.

The length and complexity of these dance forms and their associated myths would preclude any attempt at detailed description and analysis at this time. Therefore, we can examine them only in terms of their general structure.

In fact, the major point of emphasis which will be discussed, is that it is a major area of differentiation from the preceding Dramatic Narrative forms is the degree of abstraction or realism which is used in the development of the narrative relationship in the Dramatic Cycle form.

Before this subject can be discussed, it should be mentioned that there appears to be a transitional form which is intermediary in structure between the Dramatic Narrative and the Dramatic Cycle types.

Speck, in his treatment of the Cherokee dance drama, states: "In the ceremonial dance series, allegorical drama is a chief feature." The relationship with the oral narrative is unquestioned. Speck states: "According to Cherokee tradition, all tribal chanting, for whatever purpose, originated from a mythical event the slaying and sacrifice of a monster creature called "Stone Coat." It accounts for the songs that govern the dances. (Speck 1951:13)

A comparison of the Cherokee ceremonies demonstrates a strong degree of relationship with the Iroquois rituals the major difference being duration. The Cherokee dance drama, therefore, almost achieves the status of a dance cycle. The chief reason for the assignment of transitional status to these productions is that they are neither extensive in length nor performed at regularly established intervals throughout the year. Speck states "Although those Cherokee dances that may be called rites are likely to be performed in either summer or winter, the majority of the animal or social dances may be performed at any time. (Speck 1951:11)
The abstract forms of the Dance Cycle can best be illustrated by the ceremonial forms of the Pueblo Indians of the Southwest. It can best be demonstrated by quoting directly from Fawkes classic monograph on Hopi katchinas.

"There exists in Hopi mythology many stories of the old times which form an accompanying body of tradition explaining much of the symbolism and some of the ritual. In the Snake and Flute "dramatizations this coincidence of myth and ritual is more striking. The dramatic element which is ascribed to the Katchina ritual is more prominent in the elaborate than in the abbreviated versions, as would naturally be the case, but even there it is believed to be less striking than in the second group." (Fewkes 1897:253)

"In the elaborate Katchinas we find an advance in the amount of dramatization or an attempt to represent a story or parts of the same. Thus, we can in Soyaluna, follow a dramatic presentation of the legend of the conflict with the sun with hostile deities or powers, in which both are personified." (Fewkes 1897: 254)

That these performances are arranged in a specific cycle has been shown by the many accounts of Pueblo ceremonialism. Colton has stated: "The yearly calendar of the Hopi religious ceremonies is divided into two parts; from winter solstice to mid July marking the first half and from mid-July to winter solstice, the second half." (Colton 1949:2)

Fawkes has also noted that these ceremonies follow a stable pattern. "It has been proven by repeated observations of the same ceremonials that there is great constancy in the way successive presentations of the ritual are carried out year after year. Each observance is traditional and prescribed for a certain time of the year." (Fewkes 1897:255)

An examination of the details of these pueblo ceremonies and the accompanying myths shows, despite Fawkes' comment on the degree of faithfulness in reproducing the myth, that the emphasis is highly abstract. There is little attempt at direct representation in the fullest theatrical sense. The costumes and masks are supposedly fully representative of the original characters. But this would seem to be the extent of direct representation. As a point of fact, it would seem that the Katchina ceremonials have become ritualized to such an extent that the main dramatic emphasis revolves around the actual appearance of the Katchinas themselves.

On the other hand, the more realistic treatment of the Dance Cycle can be seen in the dramatic, ceremonial performances of the Northwest Coast. Drucker has expressed the situation as follows:

"The performances of the Wakashan speaking peoples ...were cycles of drama revolving around a single theme the protagonist's encounter with a spirit
who kidnaps him, bestows supernatural powers upon him, then returns him to his village, repeating the experience of the ancestor from whom the performer inherited the right to the performance." (Drucker 1955:48)

These performances were held at specified times of the year and consisted of a traditional series of dramatic representations by individuals who possessed the privilege of performing them.

The theatrical properties used in these dramatizations have been thoroughly discussed by experts on Indian art. The important point is that the use of the double and triple masks, carved figures and other such equipment was designed exclusively to increase the dramatic impact of the performance. "In one of the dance cycles the personage of highest rank was supposed to have been carried off, and upon his return inspired by a Cannibal Spirit... To prevent him from killing and eating his fellows, he was fed specially prepared human corpses. It is highly improbable that corpses were actually used; as remarked previously, the Kwakiutl were past masters at producing realistic tricks for stage effects. The smoked carcass of a small black bear, for example, fitted with a carved head, would look convincingly like a well dried human body at a little distance and by firelight into the bargain." (Drucker 1955:151)

It was Theatre carried to its highest level. The emphasis of the Northwest Coast dance cycles was deliberately centered on realism and the maintainence of the attention of the audience, Drucker has pointed out "As good dramatists, the Kwakiutl heightened the effect of the frightening and frightening scenes by alternating them either with quiet, stately dances or with periods of clowning and horseplay..." (Drucker 1955:152)

Farther to the South, the great "World's End" ceremony of the Yurok and their neighboring tribes of California involved a similar cycle with the intent of preventing the end of the world. This cycle was actually a long recitation and dramatization of the origin of the ceremony as a gift from benevolent supernatural’s.

Again it should be noted that the same inter-relationship of origins that was noted in the Dramatic Narrative is present here. The various Cannibal Society performances of the Northwest Coast were carried to such heights of accuracy in the reproduction of the myth that, as noted above, human corpses or a reasonably accurate facsimile, were used as stage properties. On the other hand, the origin myth of the "S xoaxi" ceremony of the Lummi as reported by Stern (Stern 1934:113) appears to be an explanatory description to account for a ceremony which had already been developed, even to the miraculous discovery of the already completed masks.

Finally, it should be noted that Drucker lists among the dances that might be performed as part of the "Shaman's Dance" of the Nootka such demonstrations as the Red Headed Woodpecker Imitators, Seagull Dancers, Moth Dancers, Hummingbird Imitators and even Periwinkle and Sea Cucumber Dancers (which do not
appear to be the most notable subjects for dance imitation). (Drucker 1951:401)
Therefore, we are back to the initial phases of the Dance Dramas the Imitative Pantomime, as an aspect of the Dramatic Cycle, indicating the close inter-relationship of all of these classes.

On the basis of the analysis of the dance structures we can establish certain conclusions:

1. **The Dance Drama is an important, complex within the American Indian Folk Culture.** Its universality of distribution, its vitality in execution and its continued existence in many instances, despite the encroachments of civilization, testify to its cultural importance. Under these circumstances, it is not surprising to note inter-relationships with the other folk arts.

2. **The Dance Drama is a highly organized means of expression.** It is highly traditionalized in its approach, yet fluid in its interpretations. It provides a frame of reference for the visual presentation of oral traditions and provides, at the same time, an opportunity for individual and group participation. It dramatizes the oral tradition and thereby underscores its emotional impact. But it is not simply another variant of the oral structure. It exists as an entity in its own right.

3. **The Dance Drama serves as a potent reinforcement of the folk tradition.** It is a visual expression of the folk literature, a dynamic interpretation of the folk music, an opportunity for creative expression in the plastic and graphic arts. By its inducement toward continuation of the arts, it is a cohesive factor in the maintenance of cultural integrity. It may, therefore, be regarded as a means of expressing progressively complex narrative forms.

4. **Therefore, it demonstrates the essential inter-relationship of the folk tradition.** By correlating the artistic expression in many fields of endeavor, it provides a foundation for the totality of the Arts within the complex of human society.

The Authors

Galen Snell is Dean of Students at McPherson College in McPherson, Kansas. He holds a PhD from the University of Arizona.

Bobby L. Garrett holds an MA from the University of Arizona.

Charles R. Jenkins is Associate Professor of Sociology and Anthropology at Alliance College in Cambridge Springs, Pennsylvania.

Wayne Parris is Associate Professor of Anthropology at Wichita State University, Wichita, Kansas.
Chapter Establishment Qualifications

The following is a simple list of conditions that must be fulfilled for chapter membership:

MEMBERSHIP: The upper 351 of the Anthropology majors which may be interpreted as a 2.5 overall (based on a 4.00 scale) and a 3.00 in anthropology. Anthropology undergraduates must have completed 12 hours in Anthropology, Graduate students must be in good departmental standing with a 3.25 overall.

ORGANIZATION: Your local chapter shall have a duly elected President, Vice-President, and Secretary-Treasurer. The organization may have any number of members as long as they meet the above stated academic standards. A list of members and their qualifications along with the chapter establishment fee of $25.00 must be submitted prior to chartering your chapter. With the $25.00 establishment fee, your chapter receives the certificates of membership (these are fully printed), the charter, and a basic stationery kit.

Individual membership fees are $13.00 for the first year; $10.00 of which is a life-time membership fee, $2.00 annual chapter dues, and $1.00 for the Journal. Five dollars of the life-time membership fee will be rebate to the national organization headquarters and the $1.00 Journal dues will also rebate. The balance of the funds collected are for the establishment of your treasury. Should future financial problems arise; you may call upon the national treasury for economic assistance.

PUBLICATIONS: The Lambda Alpha newsletter shall be published quarterly, The dates are not known at the present but our first issue was published in May. Our once annual M.A.N. Journal of the Lambda Alpha shall appear in November of each year. Fifty per cent of the total space of this Journal is reserved for student publications, the remaining 50% is for faculty publications. Once your chapter has been organized, please encourage your students and faculty to submit papers for our November publication.

KEYS AND PINS: Keys and pins will be available by the end of September. The cost will be between $7.50 and $12.00. The pin or key will be one inch in length and available in 10 carat white or yellow-gold filled, Included in this is a drawing of the key.
